August 2022

LET EXPERIMENT DETERMINE THE NATURE OF YUKAWA COUPLINGS

arXiv:1909.02845

- We want to know:
 - Are there more Higgs bosons?
 - If yes, what are their masses and how do they couple to the SM fermions?
- The four common $\mathbb{Z}_2$ -symmetric models' Yukawa couplings are restricted.
- Why not generalize to the A2HDM and let experiment determine the nature of the Yukawa couplings?
- 2HDM Types I, II, X, and Y may still be allowed, but experiments can tell us that, and more, from the A2HDM perspective.

FLAVOR-ALIGNED TWO-HIGGS- DOUBLET MODEL (A2HDM)

- The four common $\mathbb{Z}_2$ -symmetric 2HDM's have highly restricted Yukawa couplings.
- The A2HDM allows for more Yukawa coupling freedom in phenomenological BSM Higgs searches.

$$\begin{aligned}
 -\mathcal{L}_Y = & \bar{U}_L(\kappa^U H_1^{0\dagger} + \rho^U H_2^{0\dagger})U_R - \bar{D}_L K^\dagger(\kappa^U H_1^- + \rho^U H_2^-)U_R \\
 & + \bar{U}_L K(\kappa^{D\dagger} H_1^+ + \rho^{D\dagger} H_2^+)D_R + \bar{D}_L(\kappa^{D\dagger} H_1^0 + \rho^{D\dagger} H_2^0)D_R \\
 & + \bar{N}_L(\kappa^{E\dagger} H_1^+ + \rho^{E\dagger} H_2^+)E_R + \bar{E}_L(\kappa^{E\dagger} H_1^0 + \rho^{E\dagger} H_2^0)E_R + \text{h.c.}
 \end{aligned}$$

- In the A2HDM, the Yukawa matrices ρ^F are postulated to be proportional to the mass matrices κ^F .
 - Flavor diagonal (which avoids tree-level FCNC's)
 - ρ^F related to κ^F by coupling parameters $a^{U,D,E}$:

$$\rho^F = \epsilon_6 a^F \kappa^F$$

HIGGS ANOMALIES

- We looked for “excesses” in ATLAS and CMS BSM Higgs exclusion plots.
- For example, at $m_H = 280$ GeV we found:

Possible Evidences of a Heavy Higgs Scalar H of Mass $m_H = 280$ GeV				
Source	Channel	Observed [pb]	Expected [pb]	Comments
ATLAS arXiv 1804.06174v1	bbbb	5	2	$\sim 2.5\sigma$
ATLAS JHEP07(2020)108	bbbb	1.2	1.1	$126 \text{ fb}^{-1} \sigma_{VBF}(\text{pp-Xjj-HHjj})$
ATLAS PhysLetB 800 (2020) 135103 BR's divided out	bbbb	14	5	largest excess
	bb $\tau\tau$	3	3	Deficit at $m < 280$
	bb $\gamma\gamma$	0.7	0.8	Data zigzags expected curve 1σ excess at 300
	Combined	0.83	0.74	Small excess closer to 300
CMS JHEP08(2018)152	bbbb	0.97	0.7	1σ
CMS PAS HIG-17-030	combined	1.7	0.8	2σ
CMS PAS HIG-17-032	bbZZ ($ll\nu\nu$)	0.3	0.5	1σ deficit
CMS (assumes SM BR) BR's divided out	bb $l\nu l\nu$	15	11	
	bb $\tau\tau$	7	5	Large peak at 270
	bbbb	2.7	2.1	sharp valley near peak
	bb $\gamma\gamma$	1.30	0.83	
	Combined	1.5	0.8	
CMS PhysRevLet 122.121803	Combined	1.7	0.8	2σ

HIGGS ANOMALIES

- Here are a few of the most prominent ATLAS and CMS Higgs anomalies that we decided are worth investigating. [arXiv:2011.05639]

“Most prominent excess at $m_{A,H} = (610, 290) \text{ GeV}$ ”

HIGGS ANOMALIES

[arXiv:1908.01115]

HIGGS ANOMALIES

- A single anomalous signal is likely to be a statistical fluctuation upwards.
- Scenarios with two or more Higgs anomalies are more likely to be real signals.
- We devised two scenarios with two anomalies each, compatible with the A2HDM.

Scenario 1:

$$m_A = 610 \text{ GeV}, m_H = 280 \text{ GeV}$$

mass →	~2.3 MeV/c ²	~1.275 GeV/c ²	~173.07 GeV/c ²	0	~126 GeV/c ²
charge →	2/3	2/3	2/3	0	0
spin →	1/2	1/2	1/2	1	0
	u up	c charm	t top	g gluon	h SM-like Higgs boson
QUARKS					
	~4.8 MeV/c ²	~95 MeV/c ²	~4.18 GeV/c ²	0	280 GeV
	-1/3	-1/3	-1/3	0	0
	1/2	1/2	1/2	1	0
	d down	s strange	b bottom	γ photon	H Heavy Higgs
	0.511 MeV/c ²	105.7 MeV/c ²	1.777 GeV/c ²	91.2 GeV/c ²	610 GeV
	-1	-1	-1	0	0
	1/2	1/2	1/2	1	0
	e electron	μ muon	τ tau	Z Z boson	A CP-odd Higgs
LEPTONS					
	<2.2 eV/c ²	<0.17 MeV/c ²	<15.5 MeV/c ²	80.4 GeV/c ²	610±60 GeV
	0	1/2	1/2	±1	±1
	1/2	1/2	1/2	1	0
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	H_± Charged Higgs

Scenario 2:

$$m_A = 400 \text{ GeV}$$

mass →	~2.3 MeV/c ²	~1.275 GeV/c ²	~173.07 GeV/c ²	0	~126 GeV/c ²
charge →	2/3	2/3	2/3	0	0
spin →	1/2	1/2	1/2	1	0
	u up	c charm	t top	g gluon	h SM-like Higgs boson
QUARKS					
	~4.8 MeV/c ²	~95 MeV/c ²	~4.18 GeV/c ²	0	? GeV
	-1/3	-1/3	-1/3	0	0
	1/2	1/2	1/2	1	0
	d down	s strange	b bottom	γ photon	H Heavy Higgs
	0.511 MeV/c ²	105.7 MeV/c ²	1.777 GeV/c ²	91.2 GeV/c ²	400 GeV
	-1	-1	-1	0	0
	1/2	1/2	1/2	1	0
	e electron	μ muon	τ tau	Z Z boson	A CP-odd Higgs
LEPTONS					
	<2.2 eV/c ²	<0.17 MeV/c ²	<15.5 MeV/c ²	80.4 GeV/c ²	400±60 GeV
	0	1/2	1/2	±1	±1
	1/2	1/2	1/2	1	0
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	H_± Charged Higgs

SCENARIO I RESULTS

SCENARIO I RESULTS

SCENARIO I RESULTS

Scenario 1 - Type I and X comparison

Scenario 1 - Type II and Y comparison

SCENARIO 2 RESULTS

$b \rightarrow s + \gamma$ CONSTRAINTS

- $b \rightarrow s + \gamma$ constraints place the most stringent experimental cuts on our models.

$b \rightarrow s + \gamma$ CONSTRAINTS

- $b \rightarrow s + \gamma$ constraints place the most stringent experimental cuts on our models.
- We showed that the LO calculation of this constraint is insufficient, one must go to NLO.

$b \rightarrow s + \gamma$ CONSTRAINTS

Regions of A2HDM parameter space that satisfy the $b \rightarrow s + \gamma$ constraint at various a^U .

$b \rightarrow s + \gamma$ CONSTRAINTS

We showed the 2HDM Types I and II limits and intermediate slices of parameter space via the relationship:

$$a^U = (a^D)^p \text{sgn}(p), \quad -1 < p < 1$$

THANK YOU

- Big thank you to the institute here in Lisbon, Howie Haber, and Pedro Ferreira!
- Questions?
